

E Mich HW2

$$A = 30 \times 30 = 900 \text{ mm}^2$$

$$A = 9 \times 10^{-4} \text{ m}^2$$

800:400 turns

a) Core Reluctance, $\mu_r = 1500$ $\mu_0 = 4\pi \times 10^{-7}$

$$R_{ab} = R_{bc} = R_{cd} = R_{da}$$

$$R_t = 4(R_{ab}) \Rightarrow 4(5.3051 \text{ K}) \Rightarrow R_t = 212.206 \text{ K}\Omega$$

$$R_{ab} = \frac{l}{\mu A} = \frac{90 \times 10^{-3}}{(4\pi \times 10^{-7})(1500)(9 \times 10^{-4})} \Rightarrow R_{ab} = 5.3051 \text{ K}\Omega$$

b) L_m Referred by primary ($\frac{N_p^2}{R}$)

$$L_m = \frac{(800)^2}{212.206 \text{ K}}$$

$$L_m = 3.0159 \text{ H}$$

d) I_m

$$I_m = \frac{V_p}{R_c || L_m X_m}$$

$$I_m = \frac{240}{947.482} \Rightarrow I_m = 253.303 \text{ nA}$$

e) $\lambda = ?$ $\lambda_p = L_i$

$$\lambda_p = (3.0159)(253.303 \text{ nA})$$

$$\lambda_0 = 0.7639 \text{ mWb}$$

c) $jX_m = ?$

$$L_m \rightarrow X_m = \omega L_m, \omega = 2\pi f$$

$$X_m = (2\pi \cdot 50)(3.0159)$$

$$X_m = 947.482 \angle 90^\circ \Omega$$

$$f) \varphi = \frac{V}{R} = \frac{N_p I_m}{R}, B = \frac{\varphi}{A}$$

$$\varphi = \frac{(800)(253.303 \text{ nA})}{212.206 \text{ K}\Omega} \Rightarrow \varphi = 954.9296 \times 10^{-6} \text{ Wb}$$

$$B = \frac{954.9296 \text{ mWb}}{9 \times 10^{-4}} \Rightarrow B = 1.061 \text{ T}$$
